Phil/LPS 31 Introduction to Inductive Logic Lecture 5

David Mwakima dmwakima@uci.edu University of California, Irvine

April 12th 2023

Topics

- ▶ Inference in Quantified Relational Logic
- ► Models and Counterexamples

▶ In order to do inference in quantified relational logic we need the notions of (1) the scope of a quantifier and (2) an instance of a formula in quantified relational logic.

- ▶ In order to do inference in quantified relational logic we need the notions of (1) the scope of a quantifier and (2) an instance of a formula in quantified relational logic.
- ► The scope of quantifier are all the free variables, which it binds, in a formula.

- ▶ In order to do inference in quantified relational logic we need the notions of (1) the scope of a quantifier and (2) an instance of a formula in quantified relational logic.
- ► The scope of quantifier are all the free variables, which it binds, in a formula.
- ▶ An instance of a formula in quantified relational logic is a formula that is obtained by freeing a bound variable within the scope of a quantifier and uniformly replacing every occurrence of this free variable by a constant.

- ▶ In order to do inference in quantified relational logic we need the notions of (1) the scope of a quantifier and (2) an instance of a formula in quantified relational logic.
- ► The scope of quantifier are all the free variables, which it binds, in a formula.
- An instance of a formula in quantified relational logic is a formula that is obtained by freeing a bound variable within the scope of a quantifier and uniformly replacing every occurrence of this free variable by a constant.
- ► For each of these formulas: what is the scope of each quantifier? Provide an instance of each formula.

- ▶ In order to do inference in quantified relational logic we need the notions of (1) the scope of a quantifier and (2) an instance of a formula in quantified relational logic.
- ► The scope of quantifier are all the free variables, which it binds, in a formula.
- ▶ An instance of a formula in quantified relational logic is a formula that is obtained by freeing a bound variable within the scope of a quantifier and uniformly replacing every occurrence of this free variable by a constant.
- ► For each of these formulas: what is the scope of each quantifier? Provide an instance of each formula.
 - 1 $(\exists x(Gx))$

- ► For each of these formulas: what is the scope of each quantifier? Provide an instance of each formula.
 - $1 (\exists x (Gx))$
 - $(\forall x(\neg Gx))$

- ▶ In order to do inference in quantified relational logic we need the notions of (1) the scope of a quantifier and (2) an instance of a formula in quantified relational logic.
- ► The scope of quantifier are all the free variables, which it binds, in a formula.
- ▶ An instance of a formula in quantified relational logic is a formula that is obtained by freeing a bound variable within the scope of a quantifier and uniformly replacing every occurrence of this free variable by a constant.
- ► For each of these formulas: what is the scope of each quantifier? Provide an instance of each formula.
 - 1 $(\exists x(Gx))$
 - $(\forall x(\neg Gx))$
 - $3 (\forall x((\neg Qx) \rightarrow (\exists y(Sxy))))$

- ▶ In order to do inference in quantified relational logic we need the notions of (1) the scope of a quantifier and (2) an instance of a formula in quantified relational logic.
- ► The scope of quantifier are all the free variables, which it binds, in a formula.
- ▶ An instance of a formula in quantified relational logic is a formula that is obtained by freeing a bound variable within the scope of a quantifier and uniformly replacing every occurrence of this free variable by a constant.
- ► For each of these formulas: what is the scope of each quantifier? Provide an instance of each formula.

```
\begin{array}{l}
1 \ (\exists x (Gx)) \\
2 \ (\forall x (\neg Gx)) \\
3 \ (\forall x ((\neg Qx) \to (\exists y (Sxy)))) \\
4 \ (\forall x \forall y ((Lxy) \to (\exists z ((Lxz) \land (Lzy)))))
\end{array}
```

Finally we can state the inference rules of quantified relational logic which turn it into a deductive logic.

- Finally we can state the inference rules of quantified relational logic which turn it into a deductive logic.
 - All the truth-preserving rules of inference covered in sentential logic are truth-preserving rules of inference in quantified relational logic.

- Finally we can state the inference rules of quantified relational logic which turn it into a deductive logic.
 - All the truth-preserving rules of inference covered in sentential logic are truth-preserving rules of inference in quantified relational logic.
 - 2. From an instance of a formula \mathcal{F} infer $(\exists x \mathcal{F})$ where the formula \mathcal{F} is the result of uniformly replacing with variable x any constant in \mathcal{F} . This rule is known as Existential Generalization.

- Finally we can state the inference rules of quantified relational logic which turn it into a deductive logic.
 - All the truth-preserving rules of inference covered in sentential logic are truth-preserving rules of inference in quantified relational logic.
 - 2. From an instance of a formula \mathcal{F} infer $(\exists x \mathcal{F})$ where the formula \mathcal{F} is the result of uniformly replacing with variable x any constant in \mathcal{F} . This rule is known as Existential Generalization.
- Here is an instance of the second truth-preserving rule of inference:

- Finally we can state the inference rules of quantified relational logic which turn it into a deductive logic.
 - All the truth-preserving rules of inference covered in sentential logic are truth-preserving rules of inference in quantified relational logic.
 - 2. From an instance of a formula \mathcal{F} infer $(\exists x \mathcal{F})$ where the formula \mathcal{F} is the result of uniformly replacing with variable x any constant in \mathcal{F} . This rule is known as Existential Generalization.
- Here is an instance of the second truth-preserving rule of inference:
 - 1. Hypatia is wise. (Wh)

 - All the truth-preserving rules of inference covered in sentential logic are truth-preserving rules of inference in quantified relational logic.
 - 2. From an instance of a formula \mathcal{F} infer $(\exists x \mathcal{F})$ where the formula \mathcal{F} is the result of uniformly replacing with variable x any constant in \mathcal{F} . This rule is known as Existential Generalization.
- Here is an instance of the second truth-preserving rule of inference:
 - 1. Hypatia is wise. (Wh)
 - \therefore 2. Someone is wise. $(\exists x(Wx))$ (From 1 and By Existential Generalization)

- Inference rules continued from previous slide:
- 3. From $\exists x \mathcal{F}$, you may suppose that $\mathcal{F}(a)$ and use $\mathcal{F}(a)$ together with other premises to infer a sentence G. Here $\mathcal{F}(a)$ is the result of uniformly replacing every free occurrence of x in \mathcal{F} with an arbitrary constant a, which has not occurred before. This rule is known as Existential Supposition.

- Inference rules continued from previous slide:
- 3. From $\exists x \mathcal{F}$, you may suppose that $\mathcal{F}(a)$ and use $\mathcal{F}(a)$ together with other premises to infer a sentence G. Here $\mathcal{F}(a)$ is the result of uniformly replacing every free occurrence of x in \mathcal{F} with an arbitrary constant a, which has not occurred before. This rule is known as Existential Supposition.
- ▶ Here is an instance of this truth-preserving rule of inference:

- ► These are the only truth-preserving rules of inference that we will avail for ourselves in quantified relational logic but other rules of inference can be derived from these.

► We know why the truth-preserving rules of sentential logic are truth-preserving.

- ► We know why the truth-preserving rules of sentential logic are truth-preserving.
- ➤ Since the operator ∃ is not truth-functional, in order to say why the rule Existential Generalization and the rule Existential Supposition are a truth-preserving rules of inference, we need to discuss the semantics, interpretation or meaning of sentences in quantified relational logic.

- ► We know why the truth-preserving rules of sentential logic are truth-preserving.
- Since the operator ∃ is not truth-functional, in order to say why the rule Existential Generalization and the rule Existential Supposition are a truth-preserving rules of inference, we need to discuss the semantics, interpretation or meaning of sentences in quantified relational logic.
- ► This will require a tool which we will call a model or intended interpretation of some sentences in quantified relational logic.
